

3.3. Food security

3.3. Food security

According to analysis by the Integrated Food Security Phase Classifications (IPC),⁸⁶⁴ 27 % of the Afghan population experienced high levels of food insecurity (IPC Phase 3 and 4) in March–April 2025 and were in ‘urgent need of humanitarian food assistance’.⁸⁶⁵

Figure 6. IPC figures on the prevalence of acute food insecurity among the total population

IPC Phase	October 2023	March-April 2024	Sept-Oct 2024	March-April 2025
1: No or minimal	31 % (13.8 million)	31 % (14.1 million)	31 % (14.1 million)	32 % (14.7 million)
2: Stressed	40 % (17.7 million)	36 % (16.2 million)	44 % (20.2 million)	41 % (18.7 million)
3: Crisis	24 % (10.6 million)	25 % (11.3 million)	21 % (9.8 million)	23 % (10.6 million)
4: Acute	5 % (2.4 million)	7 % (2.9 million)	4 % (1.8 million)	4 % (1.95 million)
5: Famine	0 %	0 %	0 %	0 %

It should be noted that Food Security and Agriculture Cluster (FSAC) partners have warned that the IPC projections may severely underestimate food insecurity, since returnees are not systematically captured in the data.⁸⁶⁶ Moreover, although large parts of the population have an acceptable calorie-intake, their diets mainly consists of less nutritious food such as staples,⁸⁶⁷ while the consumption of meat, dairy and vegetables is more rare,⁸⁶⁸ which might have long-term health implications.⁸⁶⁹ WFP reported on 78 % of Afghans being unable to afford nutritious food⁸⁷⁰ and stressed that Afghanistan is experiencing an unprecedented hunger crisis in 2025,⁸⁷¹ constituting one of the worst nutrition crises in the world.⁸⁷² The WoAA from 2022 demonstrated how the percentage of households with ‘acceptable’ food consumption never exceeded 30 % in 2021–2023.⁸⁷³ Meanwhile, aid cuts have impacted the health and nutrition system that was funded with 80 % of donors, which has led to the closure of 298 WFP/UNICEF sites.⁸⁷⁴ Households have coped with food insecurity by adjusting their diets to avoid expensive food,⁸⁷⁵ and adults have been skipping meals so that their children can eat.⁸⁷⁶ Some families only consume bread and tea.⁸⁷⁷

Urban and rural areas face different challenges in terms of food security. While food insecurity is more prevalent in rural areas on a relative level,⁸⁷⁸ food is generally cheaper there⁸⁷⁹ and many households rely on their own food production⁸⁸⁰ and livestock.⁸⁸¹ For example, as outlined in a report by REACH from July 2025, Kandahar Province had the largest gap in terms of food affordability, but despite income constraints, this province as well as the ‘wider southern region’ did not report the highest levels of food

insecurity.⁸⁸² However, as mentioned above, rural communities are vulnerable to climate shocks,⁸⁸³ and some lack resources to engage in farming⁸⁸⁴ or to access food at the markets.⁸⁸⁵ For example, some households under pressure resort to eating seed stocks intended for farming, or to selling of vital livestock.⁸⁸⁶ Urban households generally do not have land assets⁸⁸⁷ or livestock, but rely on wage labour, which is volatile⁸⁸⁸ given the lack of job opportunities.⁸⁸⁹ While there is a greater availability of food products in urban areas, food is generally more expensive,⁸⁹⁰ and many households struggle to afford basic food items.⁸⁹¹ Urban households relying on different forms of wage labour are moreover vulnerable to price shocks at the markets.⁸⁹² According to a 2025 study investigating rural and urban food insecurity in Afghanistan, the large food expenditure shares, prevalence of coping strategies, and lack of savings among households suggest that both urban and rural households are vulnerable to shocks and trapped in a ‘vicious cycle’ of chronic food insecurity.⁸⁹³ In October 2025, REACH reported that the value of their Minimum Expenditure Basket reference⁸⁹⁴ was at least twice as high as the average household income.⁸⁹⁵

According to IPC, the food security situation was worst in Badakhshan in March–April 2025, with 40 % of the population classified in IPC Phase 3 and above, followed by Balkh, Bamiyan, Daykundi, Ghor, Jawzjan, Nimroz, and Sar-e-Pul (35 % of the respective populations were classified in IPC Phase 3 and above).⁸⁹⁶ REACH emphasised the vulnerability of populations without access to their own food production in areas with particularly high food prices, and in particular female-headed households and returnee households. Provinces with particularly high food prices in contrast to the average household income included the provinces of Kandahar, Baghlan, Kunar, Badakhshan, Faryab and Paktya. Kabul Province had the lowest price of Minimum Expenditure Basket in relation to the income ratio, although it should be noted that this still exceeded the average income by 71 %.⁸⁹⁷

Food insecurity has particularly impacted households headed by women,⁸⁹⁸ persons with lower education,⁸⁹⁹ persons with disabilities⁹⁰⁰ as well as returnee households.⁹⁰¹ Women’s access to food has been negatively impacted by restrictions on their mobility and access to work.⁹⁰² Meanwhile, since 2023, WFP has significantly scaled down its emergency assistance and has in parallel noted a record high increase in malnutrition in Afghanistan. In 2025 (as of June), 500 000 malnourished women and children had been left without support from WFP.⁹⁰³ IPC projections suggested that acute malnutrition would affect 1.16 million pregnant or breastfeeding women and 3.5 million children.⁹⁰⁴ UNICEF reported that about 12 % of children under 2 years received the right variety and quantity of food needed for their age.⁹⁰⁵

Child malnutrition reportedly increased after the Taliban takeover⁹⁰⁶ and has continued to increase amid dwindling aid.⁹⁰⁷ Children suffering from severe acute malnutrition commonly die.⁹⁰⁸ The most recent child malnutrition estimate and the national Standardized Monitoring and Assessment of Relief and Transitions (SMART) survey,⁹⁰⁹ both from 2022, indicated that stunting (an indicator of long-term malnutrition signified by low-height-for-age) among children under five ranged from 32.7 %⁹¹⁰ to 44.6 %.⁹¹¹ In August 2025, UNICEF and WFP launched a joint emergency appeal to address child malnutrition in Afghanistan. They noted that the country had seen the sharpest surge in child malnutrition ever recorded, and that 3.5 million children under five were affected by the nutrition crisis, with 10.3 % of them being severely malnourished.⁹¹² Media reports from local hospitals across Afghanistan also suggested a significant increase in malnourishment among children under five in recent years, with some families losing several or all their children due to lack of food and poverty.⁹¹³

⁸⁶⁴

IPC ‘provides a common scale for classifying the severity and magnitude of food insecurity and acute malnutrition’ with five phases ranging from None/Minimal (Phase 1) to Catastrophe/Famine (Phase 5). See: IPC, Understanding the IPC Scales, June 2022, [url](#), pp. 3–4
